# Module assessment

5 minutes

**Module assessment passed**

Great job! You passed the module assessment.

Score: 100%

**1. What is a *large language model* (LLM)?**

- A type of AI model designed to generate human-like text. ✓ Correct
- A model that only processes images, not text.
- A small, efficient model for mobile devices.

**2. What is the purpose of *tokenization*?**

- To sort the words in a sentence alphabetically

- To break down text into smaller units. ✓ Correct
- To convert text into binary code for processing by computers.

**3. What are *embeddings*?**

- Extra words added by a transformer model to enhance text generation.
- Small language models used for specific tasks.
- Vector-based representations of tokens that capture their semantic meaning. ✓ Correct

**4. What does an *attention* layer do in a transformer model?**

- Removes irrelevant words from the input text.
- Examines the relationships between each token and the tokens around it. ✓ Correct
- Flags inappropriate content in the generated text.

**5. What is the purpose of a *system prompt*?**

- To provide context and instructions to the AI model. ✓ Correct
- To configure a generative AI model to run on a particular operating system.
- To store user preferences for future interactions.

**6. What is an *agent* in the context of AI?**

- An AI system that can perform tasks on behalf of a user. ✓ Correct
- A generative AI model that operates in secret.
- A human operator to whom generative AI models escalate requests they can't handle.
