Module assessment passed

Great job! You passed the module assessment.

Score: 100%

1. Which statement best explains the relationship between AI and ML?

- AI and ML are interchangeable terms; both refer to systems that mimic human intelligence without distinction.
- ML focuses exclusively on generative tasks like creating text and images, whereas AI is limited to decision-making and planning.
- AI is the overarching goal of creating systems that exhibit human-like intelligence, while ML is a data-driven method used to achieve AI by learning patterns from data. ✓ Correct

2. How does Microsoft Foundry relate to Azure?

- Foundry is built on top of Azure and uses Azure resources such as compute, networking, identity, and security to host and operate AI applications. ✓ Correct
- Foundry runs independently from Azure and doesn't require Azure resources to deploy models or agents.
- Foundry replaces Azure services entirely, serving as a standalone cloud platform for running AI workloads.

3. Which statement best describes how keys, secrets, and endpoints work together in an Azure-based AI application?

- The key is the location where model responses are stored, and the endpoint retrieves those responses from Azure Key Vault.
- The endpoint stores sensitive values for an AI application, and the key determines how much data the endpoint can return.
- The endpoint is a URL for calling a deployed model, and the key (stored as a secret in Azure Key Vault) authenticates the request made to that endpoint. ✓ Correct

4. Which statement best describes a client application in the context of an AI solution built with Foundry?

- A client application is the environment that hosts the model, runs inference, and returns results.
- A client application is a program the user interacts with—such as a web app or mobile app—that sends requests to a model endpoint and displays the response. ✓ Correct
- A client application is a standalone Azure service that automatically generates API keys for model deployments.
